

To Test the power supply:

- Unplug any devices that are connected to the power supply.
- Unplug the 20 pin ATX connector from the motherboard.
- Plug the tester into the power supply's 20 pin ATX connector.
- If the POWER_OK LED lights up, the power supply is working.

Antec
Accessories

ATX Power Supply Tester

- Built-in on/off switch to allows quick and easy testing
- Built-in 25W 5.4 ohm load to generate steady outputs
- POWER_OK green LED indicates power supply is working
- +5V, +3.3V & +12V leads for volt metering to check output voltages

ATX Power Supply Tester

To test the power supply:

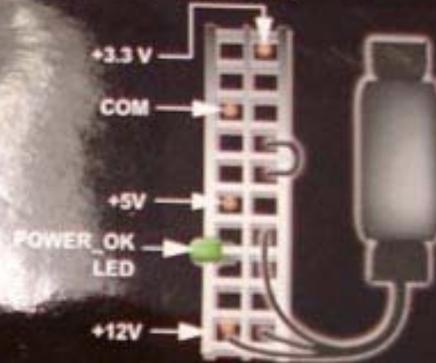

- Unplug any devices that are connected to the power supply
- Unplug the 20-pin ATX connector from the motherboard
- Plug the tester into the power supply's 20-pin ATX connector
- Turn the switch to ON position
- If the POWER_OK LED lights up, the power supply is working

To measure the voltages, you will need a volt meter. With the Tester on and the power supply running:

- Turn the volt meter dial to VDC
- Insert the black (-) pole to the COM lead and red (+) pole to the +5V lead as indicated on the diagram to read the voltage reading of the +5V
- Keeping the black pole at the COM position, change the red pole to +3.3V or +12V to measure the voltages

Warning!

- Unplug any devices that are connected to the power supply before testing, due to potential over-heat and fire hazard.
- This tester will generate heat. Don't leave the tester connected to the power supply unattended.
